

GENEALOGIES OF 14,000 WHEAT VARIETIES

ANTON C. ZEVEN & NINEKE CH. ZEVEN-HISSINK

Institute of Plant Breeding-I.v.P., Agricultural University
Wageningen, The Netherlands

Wageningen 1976

Issued by the Netherlands Cereals Centre-NGC, Wageningen and
International Maize and Wheat Improvement Center-CIMMYT, Mexico

FOREWORD

In 1964, Dr. J.G.Th. Hermesen was appointed Head of the Potato breeding research section of the Institute of Plant Breeding-I.v.P., Agricultural University, Wageningen. At that time, I took charge of the Wheat Breeding research section.

Dr. Hermesen had studied hybrid necrosis in wheat and had used pedigrees of wheat varieties to investigate the source of various Ne-alleles. For the result of his work see Euphytica 12 (1963): 1-16 and 147-160. Within the framework of my research on hybrid wheat, I carried on with the testing of varieties for their Ne-genotype for twelve years. During that period, I collected pedigrees of varieties whenever I came across them, and gathered details. Occasionally the collection was consulted by colleagues from Wageningen and elsewhere. Several times I had been asked to publish the data, but there seemed no possibility of doing so.

However, in a discussion with Dr. Gerbrand Kingma of CIMMYT, the publishing of the pedigrees was reconsidered. Publishing had become a matter of urgency, as in the near future I was to take up another subject of research, which would entail the putting away of the pedigree-collection. Such storage often means to pass into oblivion; thus other workers might unknowingly start a new and somewhat similar collection, and do the laborious job all over.

This publication, fortunately, was made possible with the help of the Netherlands Cereals Centre-NGC, the Institute of Plant Breeding-I.v.P., the Computer Centre of the Agricultural University, all at Wageningen; and CIMMYT, the International Center for Corn and Wheat Improvement, El Batán, Mexico.

A.C. Zeven
Wageningen
November, 1976

ACKNOWLEDGEMENTS

In the last ten years I have corresponded with a great number of colleagues about the pedigrees of many varieties. They have often provided the data requested. I wish to thank them for their great help. While compiling the present book I have made more inquiries. Those who responded are listed below. I am very grateful to them. I also thank Mr. J. Meuleman of the Computer Centre of the Agricultural University for his assistance in having the list printed.

USE OF THE PUBLICATION

Many researchers have investigated the inheritance of certain wheat characters including a study of the source of the characters. Such a study can be helpful for two reasons. First, when two varieties with the same character, for instance resistance to a certain strain of a certain disease, are shown to be related, it can be argued that this common character may quite well derive from a common parent and thus the chance of its being conditioned by the same gene(s) is quite high. In that case there is no point in breeding with both varieties to introduce the above character. Secondly, it is interesting to study the presence of a Ne-gene from the original parent via derived varieties to the present-day varieties. Such a gene could be linked to a desirable gene.

In my tests I included local varieties to follow the geographical distribution of Rf- and Ne-genes and their alleles. Such a study presents additional information on the spread of wheats from prehistory to our days, which makes it important for the knowledge of human cultures. Some preliminary relevant information on Ne-genes was published in *Euphytica* 15 (1966):281-284, 20 (1971):239-254, 22 (1973):618-632 and 25 (1976):255-276.

It is believed that publishing the pedigrees of "all" varieties would be helpful for present-day and future researchers and breeders, to enable them to make similar studies without first carrying out the laborious work of collecting pedigrees.

RELIABILITY OF THE WORK

All data collected in the last 10 years together with a recent, intensive search for more data in the valuable library of our institute and recent inquiries have resulted in a list of some 14.000 varieties and their pedigrees or synonyms. All breeders know that occasionally the pedigree of a variety is wrong. The causes are contamination of pollen and seed, and the mixing up of varieties. Also, names of varieties are occasionally wrong and breeders make mistakes. Such wrong pedigrees can be revealed through characters that are absent in both legitimate parents, if not caused by complementary genes. The work with the identification of the Ne-genotype has shown that in only a few cases the published pedigrees must be wrong.

FUTURE SUPPLEMENT

Colleagues will discover that not all varieties have been listed. The reason is that I did not know they existed, nor did I know where to obtain information. As many workers in the field do not know about my collection of pedigrees, it is quite possible that I, too, am unaware of the existence of other collections. Furthermore, new varieties will be bred. I will take up another research subject and thus stop collecting pedigrees. I very much hope that someone else will prepare a supplement.

CODE SYSTEM

The code system adopted is based on that of Purdy et al. (1968), which was developed for use with typewriters and computer printers. The

code system developed by Lamacraft & Finlay (1973) was seriously considered and tried out, but I experienced that, after some alterations, the first mentioned system was more suitable.

The code system is:

Crosses:

/ primary cross
// secondary cross
/3/ tertiary cross
etc.
/ ? / sequence of crosses not known (to me)

Backcrosses:

"recurrent variety's name X3/" means that three crosses have been made:
one primary cross and two backcrosses
"/3X recurrent variety's" name: ditto
"3X/ any cross" means that the cross has been used as recurrent parent

?
A "?" before a variety means that it is not sure whether the mentioned variety has been used. Similarly = ?, means that the pedigree mentioned is questionable.

, ? means nationality not known (to me).

+

A + indicates a pollen mixture of various varieties

(), - and,

These indications have no special meanings. Their use will be clear.

Code of nationality of a variety

When known, the nationality of a variety has been given. The code system followed is the "Code for the representation of names of countries" by ISO-International Organization for Standardization, Technical Committee ISO-TC 46-Documentation, October 1972.

W, I and S

W, I and S stand for winter habit, intermediate habit, and spring habit.

When known they have been given. It should be kept in mind that a habit holds good for the country of origin. e.g. a winter variety from Italy can be grown as a spring wheat variety in cool countries. The amount of cold requirement differs per variety and is not necessarily correlated with winter hardiness.

Breeder's cross or line codes have not been given as they have a limited meaning for general use. Some breeder's codes have been included in the pedigree, either because the pedigree of the breeding parent was not known (to me) or to shorten the pedigree. In the last case the breeder's code has been enlisted.

Example

As an example I use the model presented by Purdy et al.

Old ----- = $\frac{[(SKY \times LARK^2) \times ROCK^4] \times [POLE \times (DALE \times BIBB)]}{\times STONE^6}$
 Purdy et al. -- = SKY/2*LARK//ROCK*4/3/POLE//DALE/BIBB/4/6*STONE
 Present ----- = SKY/2X LARK//ROCK X4/3/POLE//DALE/BIBB/4/6X STONE
